

PERSONAL MEDIA TRACKER

PROJECT CHARTER

ABSTRACT

The Personal Media Tracker project aims to design and develop a unified desktop application that allows users to track, organize, and review both movies and television shows within a single platform. Unlike existing media trackers that focus on specific types of content or genres, this application emphasizes versatility, usability, and centralized data management. The system will allow users to store ratings, written reviews, and completion progress while sourcing media titles from a larger database. This project charter outlines the scope, objectives, deliverables, and success criteria for the development of the Personal Media Tracker.

2 PROJECT SUMMARY

The goal of the Personal Media Tracker project is to create a desktop application that enables users to track and manage both movies and television shows in one centralized system. While existing platforms such as Letterboxd, MyDramaList, and MyAnimeList specialize in specific types of media, this project focuses on adapting for a variety of media in a single application. The tracker will allow users to record completion of progress, assign personal ratings, and write reviews for each title. By integrating data from a larger media database, the application will provide a streamlined and flexible alternative to using multiple specialized platforms.

Jessamine Magalona	Designer, User Experience

4 SCOPE

This project includes the design and development of a desktop-based Personal Media Tracker application. The application will allow users to track movies and television shows by storing completion progress, personal ratings, and written reviews. Media titles will be sourced from a larger external database to support scalability and long-term usability.

Features and functionalities that are not included in this project are explicitly defined in Section 4.4, *Out-of-Scope*.

4.1 GOALS AND OBJECTIVES (10)

- Source movie and television show data from comprehensive media databases
- Support the addition of new movie and television releases over time
- Handle inactive or removed titles within the database
- Provide application access through a desktop-based interface
- Develop a dynamic user interface for querying and viewing media information
- Create and maintain a clean, unified database for application use
- Allow users to enter, store, and modify ratings and written reviews
- Implement user account creation and management
- Develop tracking features for completion progress
- Support multiple user instances within the application

4.2 DELIVERABLES

- **Desktop Application**
 - Local personal data storage
 - User interface for tracking movies and television shows
 - Developed as a standalone desktop application
- **Development Phases**
 - **Phase 1:** User interface mockups and data entry fields
 - Input, store, and retrieve user data
 - **Phase 2:** Integration with external media databases
 - Querying, parsing, and storing title data
 - **Phase 3:** Fully functional application with a dynamic interface
- **Version Control**
 - GitHub repository for source control and collaborative development

4.3 STAKEHOLDERS

<u>Role</u>	<u>Interest/Impact</u>
Users/Customers	Desire for a simple, unified platform to track all movies and TV shows Provide feedback and continued use to determine project success
Software developers (Software Engineers)	Desire to create a platform for users to be happy with Responsible for developing a scalable, maintainable, system for long-term sustainability
Project managers	Desire for a complete project within the time restraints Accountable for managing scope, schedule, and delivery for project success

4.4 OUT - OF - SCOPE

- Social features such as connecting with other users – time constraint, network capabilities, security
- Automatic updates to the database – time constraint, lack of expertise/technology, security
- In-depth media descriptions (cast, episode summaries, etc) – time constraint, lack of data, optional feature

4.5 RISKS, CONSTRAINTS, ASSUMPTIONS

<u>Risk/Constraint/Assumption Title</u>	<u>Explanation</u>
Unreliable Data from Media Databases	There are databases with inaccurate or corrupt data. Including but not limited to; misspellings, inaccurate titles or information, duplicate titles.
Niche Titles	Titles that are rarer may not appear on public or large databases. This would be a limiting factor to what the user can track.
Joint Database Integration	Finding a single database with all the media types can be difficult, and combining multiple databases into a single unified database may lead to inconsistencies, duplicates, and other erroneous data
Performance/Scalability Issue	A large database could cause slow load times, which may increase further as the database grows.
Scope Issue	Adding too many features may cause an extension in development time of the project.
Database availability	Assumption that the databases that are being used will be available in the future. Could cause issues for maintainability if they become unavailable in the future.

5 SUCCESS MEASUREMENTS

All core features of the desktop application, including the tracking of movies and television shows, will be implemented and validated through system testing. The application will demonstrate the ability to store and manage an expanding media database as new titles are released, with minimal performance degradation observed during testing. Compared to similar media tracking applications, the Personal Media Tracker is expected to achieve an estimated 15% improvement in response time under equivalent conditions. Additionally, the use of a high-contrast, accessibility-conscious interface enhances usability and broadens the potential user base, potentially improving overall user experience by an estimated 20%.

7 APPENDIX A – GLOSSARY

- **Personal Media Tracker:** A desktop application designed to allow users to track movies and television shows.
- **Media Database:** An external data source that provides information on movies and television shows used by the application.
- **User Interface (UI):** The visual components through which users interact with the application.
- **User Experience (UX):** The overall experience and usability of the application from the user's perspective.
- **System Testing:** The process of validating that all application features function as intended.
